

A scatter plot showing the effect on passing the five-year proof (points) for 45 different countries. The x-axis ranges from -10 to 10. Countries are represented by numbered points of varying sizes and colors (grey, orange, blue). The plot shows a general trend where countries with higher effects on passing the five-year proof (positive x-axis) tend to have higher values on the y-axis, although there is significant scatter. Notable outliers include country 32 (blue, far right) and country 15 (grey, top center).

Effect on renewal at year ten, given the proof (points)

Effect on passing the five-year proof (points)
